DETAILED ACTION

- 1. Applicant's election with traverse of Group I in the reply filed on September 30, 2004 is acknowledged. In view of applicant's argument, the Examiner regrouped Group I invention to include claims 55-61 and 76-87, and all of those claims were examined in this Office action.
- 2. Applicant canceled claims 62-70, 71-75, 88-96, and 97-100.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 4. Claims 55-57, 59-61, 76-78, and 82-87 are rejected under 35 U.S.C. 102(e) as being anticipated by Jiang et al (US 6,515,355 B1).

The applied reference has a common assignee with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

Application/Control Number: 10/702,238

Art Unit: 1752

In Fig.9A-9C, Jiang illustrates a stackable integrated circuit device (see col.4, lines 62-67, col.5, lines 24-49). Jiang forms a patterned passivation layer (56) by deposing a layer of *PPMS* (plasma polymerized methylsilane) and patternwise exposing (*in air or other oxygen environment* –see col.3, lines 62-64) the PPMS to deep UV light (the exposed portions being confined to that areas in which passivation is desired). The portions of the PPMS over which passivation is not desired (e.g., the solder bass pads 52) are not exposed to the UV light, and the oxide-like *PPMSO* (a crosslinked *siloxane* network) passivation layer is thus formed only where desired, leaving PPMS over the solder ball pads 52. The unexposed portions of the PPMS layer are thereafter developed by exposure to *dry chlorine plasma treatment*. Exposure to this chlorine plasma removes the unexposed PPMS, while leaving the exposed PPMSO passivation layer 56 unharmed. Thus, the solder ball pads 52 remain exposed and available for contact with solder balls 14' from an overlying packaged substrate 50.

Jiang's PPMS teaches present photodefinable layer and his PPMSO teaches present insulative material. Since only the unexposed portion of the PPMS layer (i.e., the portion in which the solder ball pads is exposed after the dry chlorine plasma treatment) is available for contact with solder balls (to form *electrical connection*) while the exposed portion of the PPMS layer (the oxide-like PPMSO) is not available for such contact, it is the Examiner's position that the exposed portion of the PPMS layer of Jiang is being used as a patterned mask for further processing steps as presently recited. Also, Jiang's passivation layer (the PPMSO layer) is being left within the semiconductor device. Thus, the prior art teaches present inventions of claims 55-57, 59-61, 76-78, and 82-87.

Application/Control Number: 10/702,238

Art Unit: 1752

Page 4

Claims 58 and 79-81 are objected to as being dependent upon a rejected base 5. claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims. Jiang does not teach or suggest present step of converting PPMSO layer to oxide through exposure to an oxygen plasma (and consolidating the oxide layer with an anneal).

Any inquiry concerning this communication or earlier communications from the 6. examiner should be directed to Sin J. Lee whose telephone number is 571-272-1333. The examiner can normally be reached on Monday-Friday from 9:00 am EST to 5:30 pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Cynthia Kelly, can be reached on 571-272-1526. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
